1. Class Diagram

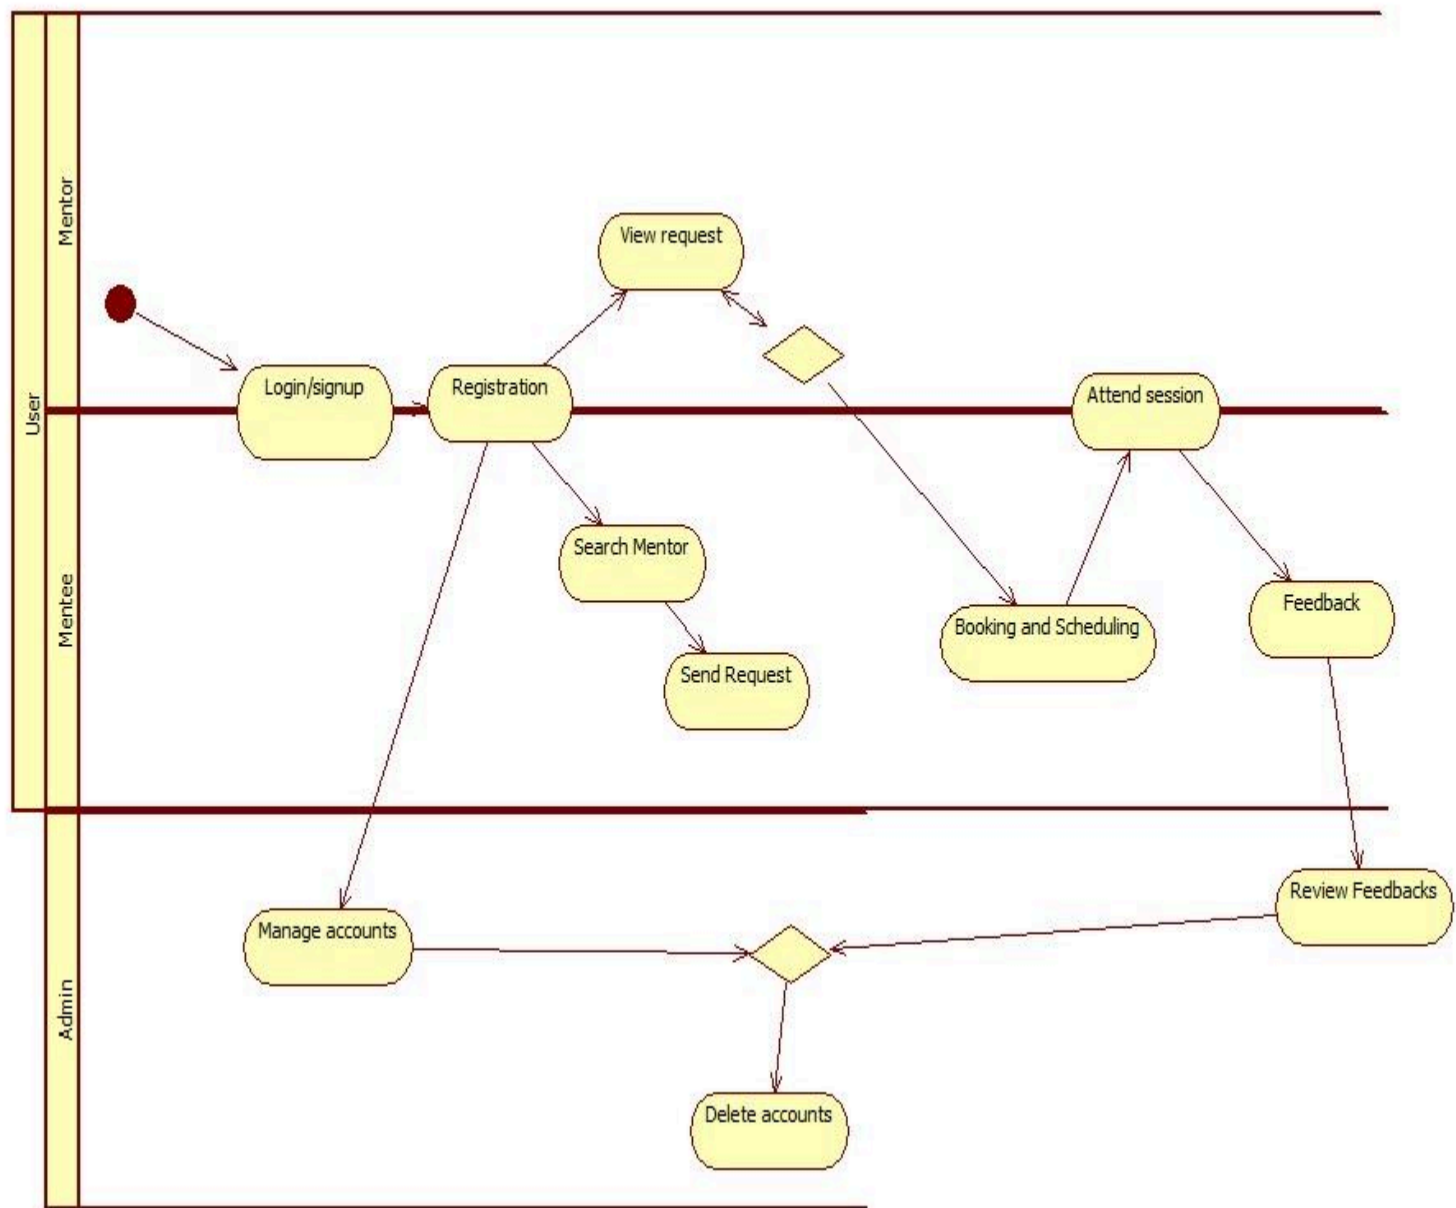

A class diagram is a UML diagram that represents the structure of a system using classes, attributes, methods, and relationships. It helps developers visualize how different classes interact with each other in a software system.

2. Activity Diagram

An activity diagram is a UML diagram that shows the flow of activities or actions in a system. It represents how a process starts, moves through different steps, makes decisions, and ends.

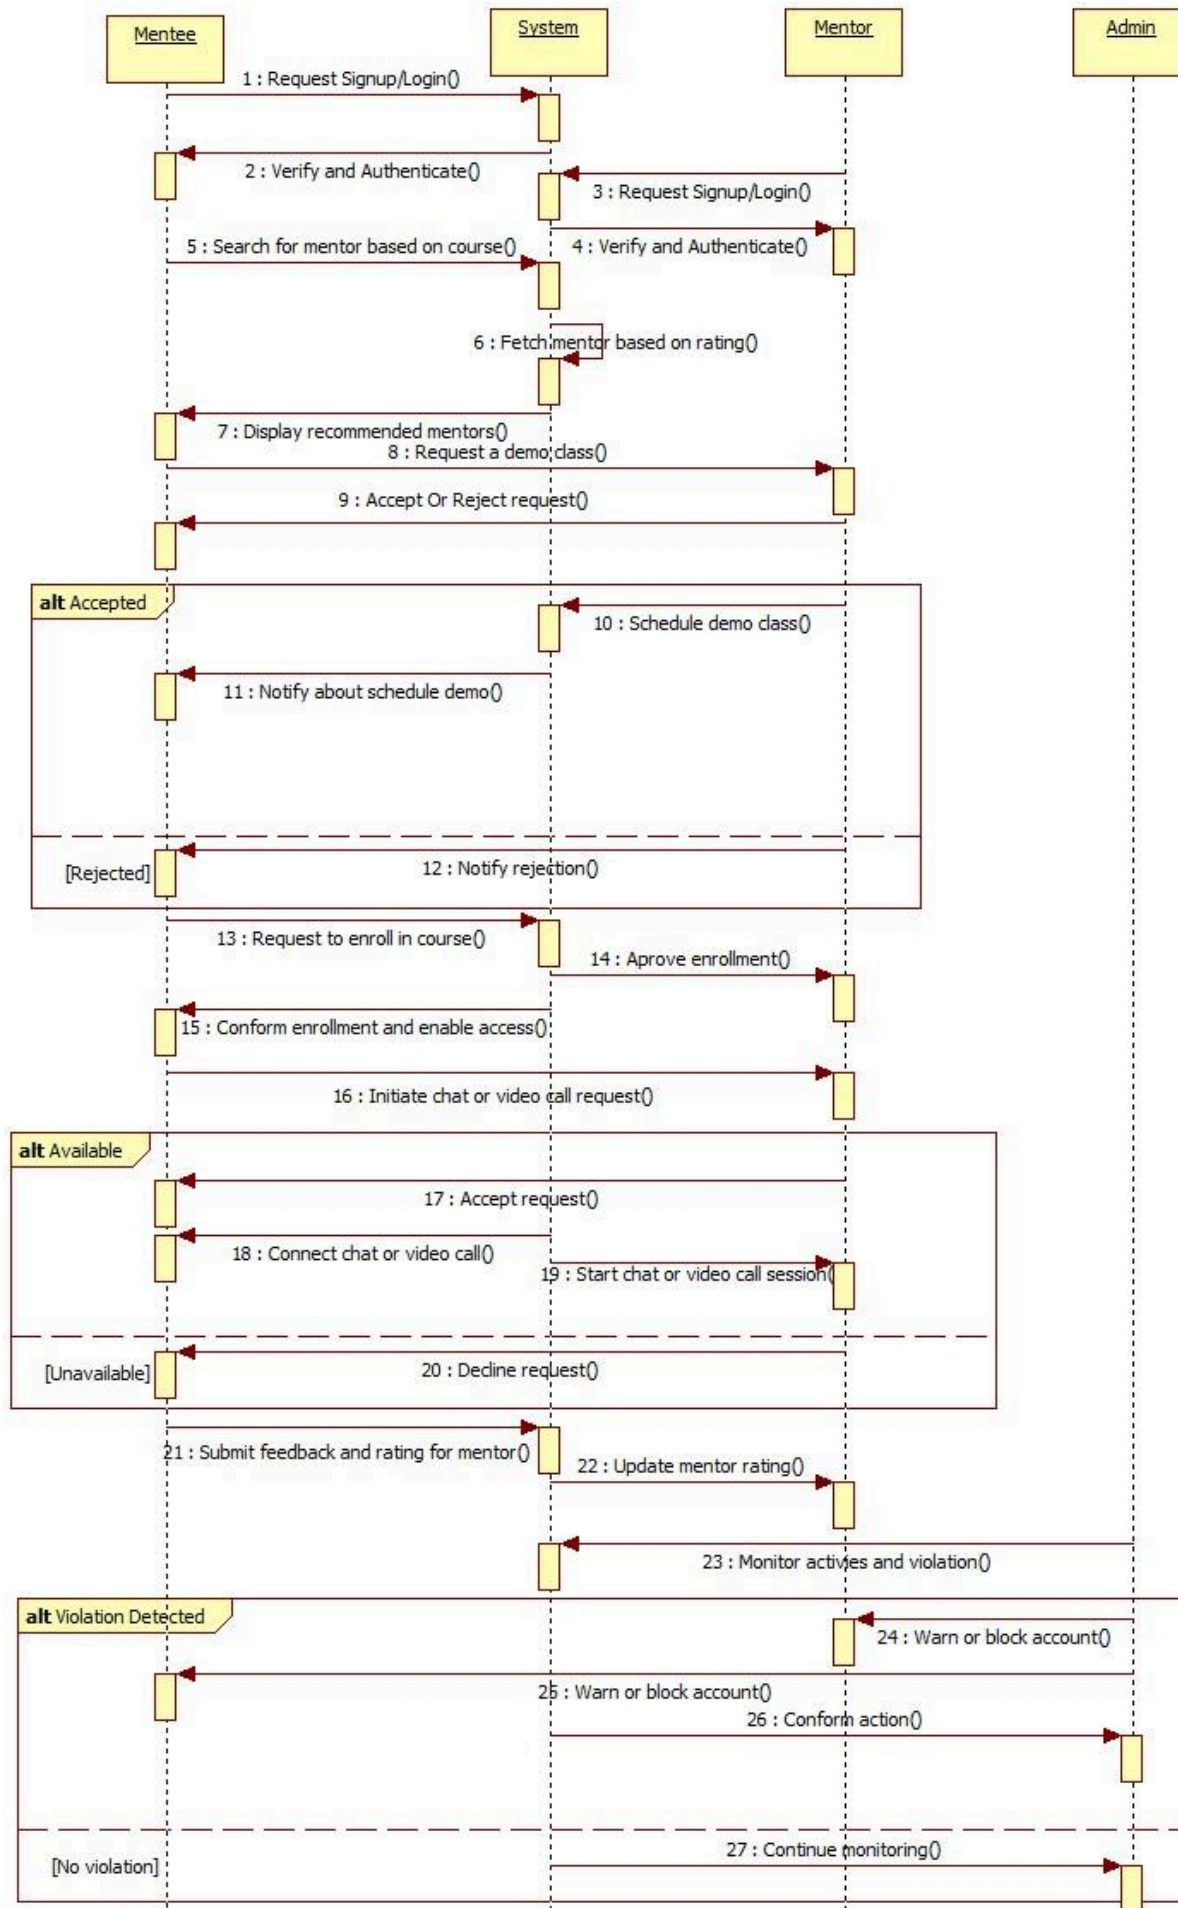

3. Swimlane diagram

A swimlane diagram is a type of activity/flow diagram that shows which person, team, department, or system is responsible for each activity.

It divides the process into lanes, with each lane representing a responsible actor—for example, Customer → Payment System → Admin.

4. Sequence Diagram

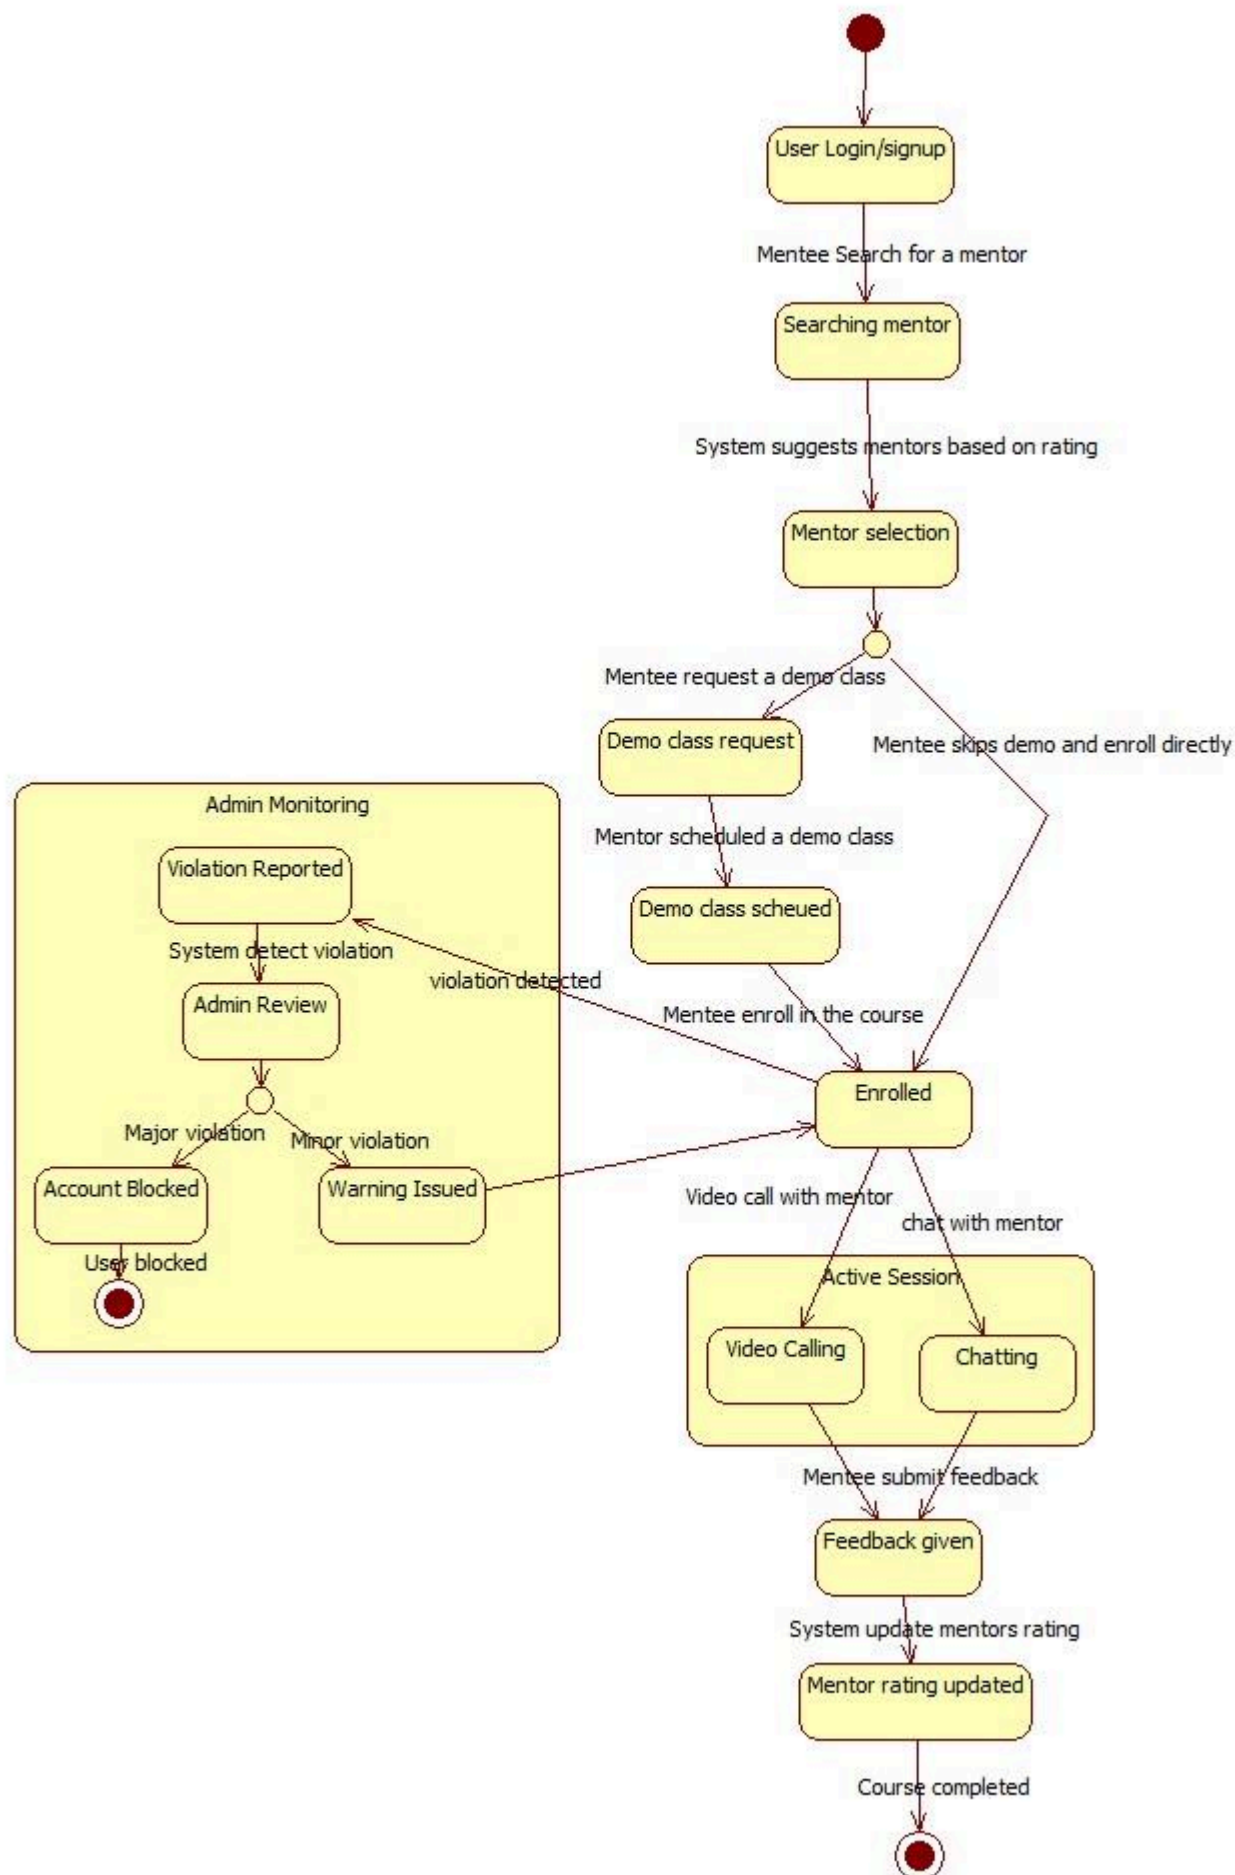

A sequence diagram is a UML diagram that shows how objects or components interact with each other in a specific sequence over time.

It represents the order in which messages or requests are sent between different objects in a system.

Example: User → Login Page → Server → Database → Server → Login Page → User.

5. State Machine Diagram

A state machine diagram is a UML diagram that shows the different states of an object/system and how it changes from one state to another based on events or conditions.

Example: Logged Out → Login → Logged In → Logout → Logged Out — it shows the state changes of a user in a system.
